BY APPOINTMENT OPTICIANS TO HER LATE MAJESTY QUEEN MARY

DIXEY

Illuminated Binocular Microscope for Gonioscopy

This instrument, made of light weight alloy, was devised in conjunction with Dr. W. J. Wellwood Ferguson of Sheffield.

A 12 watt bulb is contained in the handle and the light is projected between the objectives. A rotating disc gives different sizes of slit and circular apertures. Magnification X10. Price, complete with transformer, £75.

Gonioscopy lenses, for use with above, available in 3 sizes, £3.10.0 each.

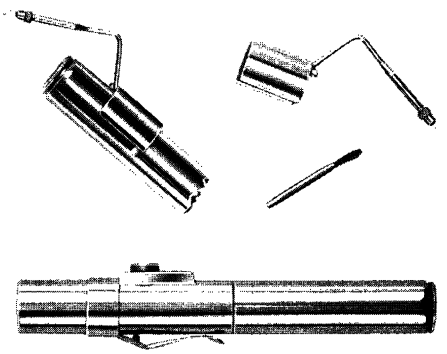
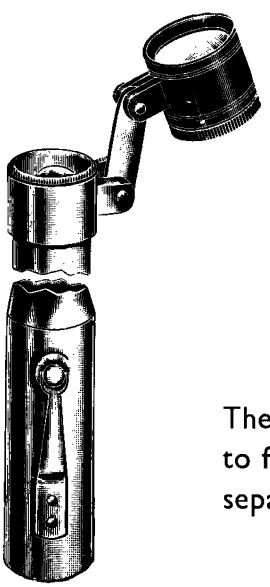
The Berson Loop and Corneal Magnifier





An ingeniously designed and simply operated instrument facilitating illumination, inspection, and removal of superficial foreign bodies from the eye.

An interchangeable holder which can carry either a nylon loop or a camel hair brush is attached by means of a special spring clip to any normal type of fountain pen torch.

The corneal magnifier can be supplied either to fit the pen torch, as illustrated, or as a separate hand instrument.

Further details on request.

THE

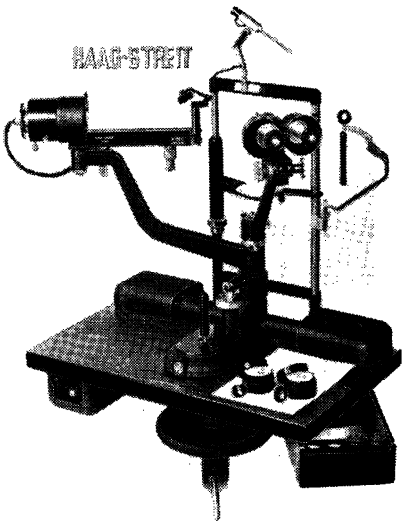
HAAG-STREIT

GOLDMANN

SLIT-LAMP

AND

BIOMICROSCOPE



£275

Less allowance for present slit-lamp or Ophthalmometer if in sound basic order

The advantages of the modern slit-lamp are due primarily no doubt to improvement of the illumination system both in the intensity available and general reliability.

Secondly by bringing slit and microscope to a constant point of common focus. The resulting unification of control has produced an instrument no more complex in its operation than the usual laboratory microscope.

The slit-lamp is lately becoming almost as popular with the Physician in the Medical Department as hitherto with the Ophthalmic Surgeon.

The Haag-Streit Slit-Lamp has not surprisingly found general approval in this wide field. Such a design proved over more than a decade of increasing demand can almost be accepted as an element of logic.

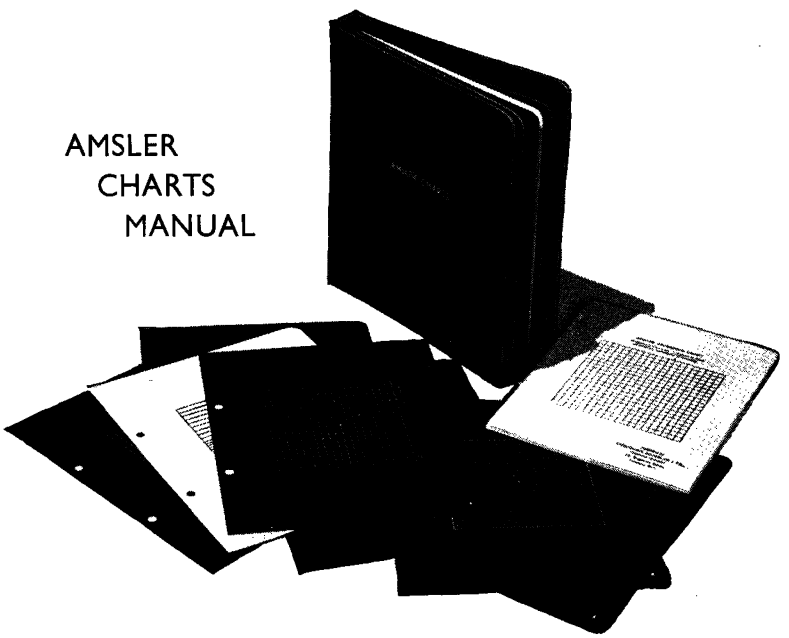
AMSLER
CHARTS
MANUAL

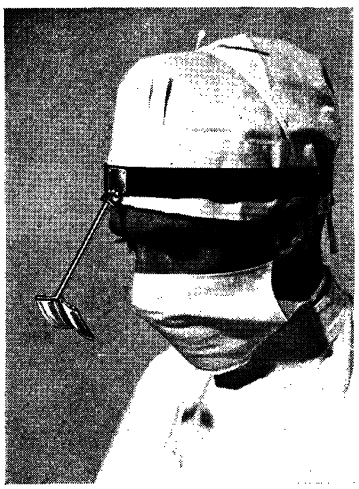


These charts, designed by Professor Marc Amsler of Zürich, were demonstrated by him at the 1949 Oxford Ophthalmological Congress. They make it possible to detect, localise, and analyse the visual functional disturbances (metamorphopsia, relative scotoma) which accompany the beginning and evolution of maculopathies. Many functional disturbances affecting the central and paracentral region of the field escape the usual quantitative test of central vision since it does not really bring into account the quality of the visual trouble. By means of these charts and the method and technique of examination described by Professor Amsler such qualitative measurements are easily made.

Seven charts in substantially bound book with set of 50 recording charts on tear-off pad, and full instructions for their use by Professor Amsler.

Note.—Spanish, French and German editions are available at same price.

THE KEELER HEADBAND LOUPE



Ref. 1040E

The 1·5X Loupe is more comfortable than a spectacle magnifier and does not hinder manipulative work. The lenses are about 6 in. from the eyes and the same distance from the patient.

The lower illustration shows how the Loupe may be put out of the way, ready to be swung down whenever magnification is required. This is useful in the clinic as well as in the operating theatre.

HAMBLIN'S PURVIS STREAK RETINOSCOPE

The Purvis Streak Retinoscope made by Hamblin is of special value because it produces a reflex less confusing than that from a round spot of light, and because it enables the axis of astigmatism to be located with accuracy.

The strength of the light is controlled by a rheostat incorporated in the switch.

The width of the beam or streak of light is controlled by the sliding sleeve. The sleeve is pushed up to make the beam convergent and down to make it divergent. The divergent beam corresponds to the use of a plane mirror, and the convergent beam to a concave mirror.

For plane mirror Retinoscopy, it is only necessary to move the sleeve downwards, past the point at which the light is in sharp focus at one metre, until the beam is from ¼ to ½ inch in width.

Alterations in the axis of the streak are governed by rotating the lower sleeve around the stem of the instrument by a lateral rolling movement of the forefinger.

two aspects of treating ocular conditions with

Terra-Cortril*

brand of oxytetracycline hydrochloride and hydrocortisone

Terra-Cortril ophthalmic suspension is of outstanding value in two groups of eye conditions: where an inflammatory process is complicated by infection or the risk of infection, and where treatment of infection is hindered by the presence of excessive inflammation.

Control of Inflammation

The hydrocortisone in Terra-Cortril Ophthalmic Suspension quickly reduces inflammation, relieving symptoms and reducing the risk of permanent damage from scarring.

Control of Infection

Terra-Cortril Ophthalmic Suspension also contains Terramycin.* This potent and unusually well tolerated antibiotic rapidly controls infection, and will prevent the emergence of infection during treatment of a simple inflammatory reaction.

In each ml. of controlled-viscosity gel-like base Terra-Cortril Ophthalmic Suspension contains 15 mg. hydrocortisone acetate 5 mg. oxytetracycline hydrochloride and 10,000 units Spolymyxin B. Sulphate. The suspension is available in 10 ml. amber bottles. An eye-dropper is provided.

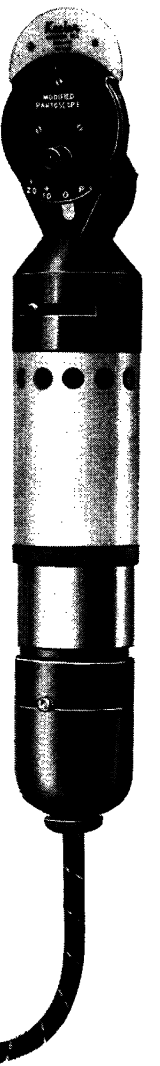
THE "MODIFIED" PANTOSCOPE

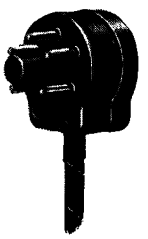
The recently introduced "Modified" Pantoscope is for the specialist who appreciates simplicity combined with brilliant illumination - 12v. 12w, which is more than adequate for any fundus examination even in daylight.

It gives the same superb vision as the famous Pantoscope but for direct and indirect ophthalmoscopy only.



Detailed features include:

★ Macular beam, Iris Diaphragm.
★ Ordinary or Polarised light.
★ +40D. to −25D. viewing lenses.
★ +20D. swing-over lens for corneal and anterior chamber examination.
★ +10D. swing-over lens for examination of lens and vitreous.
★ Compact filament lamp with plano cap for homogenous light on fundus.



Cloudy media, small pupils.

For better vision under such conditions, the MODIFIED Pantoscope with narrow macular beam, polarised light and full 12-watt power, gives excellent results.

The Modified Pantoscope illustrated is fitted with the SELECT-a-LITE switchbase which provides finger-tip brightness control as part of the ophthalmoscope. Illumination can be varied while observing the fundus. The "3-way & off" switch gives 6 volts for ordinary direct ophthalmoscopy, 9 volts for use in polarised light and 12 volts for indirect opthalmoscopy.

THE VISUSCOPE AND EUTHYSCOPE

manufactured by

OCULUS

Enquiries for the Visuscope and Euthyscope and the associated flashing device used in treatment, will be welcomed. A limited amount of literature is available, but shortly we hope to be in a position to meet all enquiries and to offer the instruments for short trial periods.

Clement Clarke Present

GOLDMANN APLANATION TONOMETER

The APLANATION TONOMETER, manufactured by HAAG-STREIT, is the result of several years of intensive study of tonometry in Professor Goldmann's clinic at Berne. The instrument is used in conjunction with the Goldmann Slit-lamp as is shown in the illustration. We have imported the first Aplanation Tonometer into this country and are now in a position to invite enquiries.

* OTHER HAAG-STREIT APPARATUS *which can be supplied from Stock includes the Slit Lamp, Projection Perimeter, Ophthalmometer and Adaptometer. Servicing facilities (on site or at our Works) are available for all Haag-Streit instruments.*

LADY WITH AN APPOINTMENT

Our model is not wearing spectacles. If it were necessary she would undoubtedly be attracted by a Spiller frame made to suit her features, her dress style and her purse. Such a frame might be the Spiller "Vivienne" Supra. This is a lovely new style in Perspex. Special care has been taken to ensure that the frame is extra light in weight. There is, of course, a full range of colours available.
