TWO CASES FROM MALAYA*

The following case notes, received from Dr. B. M. McOwan, of the General Hospital, Penang, Malaya, are unusually brief, but are being published for the sake of the drama of the illustrations.

(1) Strabismus Fixus.—Patient 3646/56 before and after operation (Figs 1 and 2).

(2) Orbital Tumour.—Patient 1485/57 before and one week after operation (Figs 3 and 4). This was found to be a cystic growth entirely in the muscle cone. X-rays showed an enormous expansion of the orbital margins and of the optic foramen without erosion. There was no pulsation on coughing, etc.

The histological report was inconclusive, but the pathologist thought the tumour must have been a haemangioma.

* Received for publication June 7, 1957.
