ABSTRACT

Aim: To investigate whether clinical manifestations of anterior uveitis in patients with varicella zoster virus (VZV) in the aqueous humor are associated with the viral load of VZV in the aqueous humor. The viral load of VZV in the aqueous humor was measured in a quantitative real-time PCR. Therefore, this study aimed to quantitatively measure the viral load of VZV in the aqueous humor and analyse the correlation between viral load in the aqueous humor and clinical manifestations of VZV anterior uveitis in patients with HZO and ZSH.

MATERIALS AND METHODS

Subjects

The subjects were eight patients (three men and five women; age range 45–71 years (mean 61)) with diagnosed VZV anterior uveitis at Tokyo Medical and Dental University Hospital and Miyata Hospital between December 1999 and September 2007. The clinical diagnosis of VZV anterior uveitis was based on observation of anterior uveitis associated with either HZO or ZSH. After informed consent had been obtained, an aliquot of aqueous humor (0.1–0.2 ml) was obtained from each patient. The research followed the tenets of the Declaration of Helsinki, and the study was approved by the institutional ethics committees of Tokyo Medical and Dental University.

PCR assay

The aqueous humor samples were centrifuged at 3000 rpm for 5 min and used for the following PCR assays: multiplex PCR and real-time PCR. Multiplex PCR was designed to qualitatively measure the genomic DNA of eight human herpes viruses: herpes simplex virus type 1 (HSV-1) and type 2 (HSV-2), VZV, Epstein–Barr virus (EBV), cytomegalovirus (CMV), human herpes virus type 6 (HHV-6), type 7 (HHV-7) and type 8 (HHV-8). DNA was extracted from the aqueous humor samples using a DNA minikit (Qiagen, Valencia, CA, USA). Multiplex PCR was performed using LightCycler (Roche, Basle, Switzerland). The primer sequences and PCR conditions for VZV were as previously described. Real-time PCR was performed only for HHV, the genomic DNA of which was detected by multiplex PCR.

Varicella zoster virus (VZV) affects the first branch of the trigeminal nerve and is known to cause unilateral anterior uveitis (VZV anterior uveitis) characterised by mutton-fat keratic precipitates (KPs), trabecular meshwork pigmentation, ocular hypertension, iris atrophy and distorted pupil. Systemic signs in VZV iridocyclitis can be herpes zoster ophthalmicus (HZO) with skin eruptions or zoster sine herpete (ZSH) without skin eruptions but solely with neuralgia. Using PCR, previous studies have revealed genomic DNA of VZV in the aqueous humor in patients with anterior uveitis with HZO and ZSH. Recent advances in molecular biology now make it possible for quantitative measurement of the viral load using real-time PCR. Therefore, this study aimed to quantitatively measure the viral load of VZV in the aqueous humor and analyse the correlation between viral load in the aqueous humor and clinical manifestations of VZV anterior uveitis in patients with HZO and ZSH.

Statistical analysis
Statistical analysis was performed using the Mann–Whitney U test. Statistical significance was set at p < 0.05.

RESULTS
Clinical manifestations
In four of the patients, there was an episode of skin eruption with neuralgia in the area of the first branch of the trigeminal nerve; this was clinically diagnosed as HZO (table 1). No skin eruptions were observed in the other patients, although they complained of pain near the first branch of the trigeminal nerve, leading to the diagnosis of ZSH. At various intervals after the onset of HZO or ZSH, the patients developed unilateral anterior uveitis. All patients had cells and flare in the anterior chamber, with increased flare values measured by a laser flare meter (Cowa, Tokyo, Japan). Four patients exhibited mutton-fat KPs (table 1), which had brownish pigmentation and were small or medium in size. Three patients with HZO already exhibited iris atrophy and pupil distortion on referral. High intraocular pressure (IOP) was recorded in all patients except in case 3 (table 1). A gonioscopic examination revealed wide, open angles in all patients, and higher pigmentation in the affected eye than the other eye in six of the eight patients. Ophthalmoscopic examinations revealed no significant inflammatory lesions in the retina and choroid. These clinical results led us to a diagnosis of anterior uveitis associated with HZO or ZSH, with paracentesis subsequently performed in order to carry out the PCR analysis.

Aqueous humor samples from eight cases were analysed for human herpes virus DNA by multiplex PCR. *Herpes viruses excluding VZV, ie, herpes simplex virus type 1 and type 2, Epstein–Barr virus, cytomegalovirus, human herpes virus types 6, 7 and 8. VA, visual acuity; IOP, intraocular pressure; KPs, keratic precipitates; AC, anterior chamber.

Statistical analysis
Statistical analysis was performed using the Mann–Whitney U test. Statistical significance was set at p < 0.05.

PCR analysis of the aqueous humor
Qualitative PCR (multiplex PCR) detected genomic DNA of VZV but not of other human herpes viruses (HSV-1, HSV-2, EBV, CMV, HHV-6, HHV-7 and HHV-8) in the aqueous humor of all eight patients (table 1). In peripheral blood samples, however, no genomic DNA of any of the eight human herpes viruses, including VZV, was detected in any of the patients.

Quantitative PCR (real-time PCR) detected significant viral loads of VZV DNA in the aqueous humor of the eight patients ranging from $3.8 \times 10^7$ to $1.2 \times 10^8$ copies/ml (table 2). It is of note that the VZV viral load in the aqueous humor correlated with the intensity of iris atrophy and pupil distortion (table 2, fig 1). Patient 1 had the highest VZV viral load ($1.2 \times 10^8$ copies/ml) in the aqueous humor and also had the most severe iris atrophy, with multiple wide areas of segmental iris atrophy and a widely dilated pupil (fig 1A, table 2). Patients 2–5 had the second...
highest viral loads in the aqueous humor (∼1×10^6 copies/ml), and these patients developed multiple segmental or circular iris atrophy with moderate pupil distortion, although these signs were not as marked as in patient 1 (fig 1B–E, table 2). Patients 6 and 7 had the third highest viral load (10^3–10^4 copies/ml) and exhibited circular iris atrophy with minimum pupil distortion (fig 1F,G). Patient 8 had the lowest viral load. This patient exhibited no iris atrophy and the pupil remained normal throughout the clinical course.

We next examined whether higher viral load in the aqueous humor was significantly associated with the intensity of the iris atrophy and pupil distortion. For this analysis, we separated the patients into two groups: higher viral load (patients 1–5) and lower viral load (patients 6–8). The extent of iris atrophy was significantly (p<0.05) larger in the group with higher viral load. In addition, the maximum pupil diameter in the pupil distortion was significantly (p<0.05) larger in the group with higher viral load. These results suggest that higher viral load in the aqueous humor is closely associated with the intensity of the iris atrophy and pupil distortion.

**DISCUSSION**

Human herpes viruses are known to be involved in many ocular pathological conditions, such as keratitis, anterior uveitis and necrotising retinitis. Early treatment with anti-viral agents, based on a rapid and accurate diagnosis of the viral infection in ocular tissues, is clinically important in order to avoid the irreversible tissue damage and visual impairment caused by viral infection. Recent advances in PCR methodology have made it possible to screen for viral infection and further quantify the intensity of the viral infection in ocular inflammatory diseases.1–3, 5–8. Asano et al detected herpes virus DNA (VZV or HSV-2) in three cases of acute retinal necrosis using real-time PCR. They monitored viral load in ocular samples of these patients and examined correlations with disease activities of acute retinal necrosis. In this study, we used multiplex PCR to screen for HHV infections (HHV1–8) and real-time PCR to quantify viral load in the aqueous humor of all eight patients with HZO and ZSH. Unlike iris atrophy, IOP did not correlate with the viral load in the aqueous humor. All but one of the patients had raised IOP ranging from 22 to 46 mm Hg at the onset of anterior uveitis.

This study did not reveal any pathological mechanisms for the correlation of the high VZV viral load with the iris atrophy. However, a previous immunohistological report detected VZV antigens in the stroma and vascular endothelial cells of the iris in anterior uveitis patients with HZO.9 Another study that used angiography in a patient with HZO showed that there was occlusion of the blood vessels of the atrophic iris.10 On the basis of previous studies and our present data, we hypothesise that the pathological changes caused by VZV may induce occlusion of the iris vessel leading to iris muscle paralysis, with a net result of iris atrophy and pupil distortion. The higher the viral load in the anterior chamber, the more VZVs there will be in the iris, and thus the more intense the pathological tissue damage.

Early initiation of systemic anti-viral agents, as guided by PCR analysis, would help to avoid, or at least minimise, tissue damage in the iris. Some patients with HZO were only given 1-week systemic anti-viral treatments after the onset of the skin lesions. In these patients, the viral loads of VZV in the aqueous humor were high, and various degrees of iris atrophy and distorted pupil were seen over time. These observations suggest that systemic anti-viral treatments after the onset of HZO are helpful in avoiding or minimising irreversible ocular complications and that qualitative and quantitative PCR can also provide useful information for developing treatments for such patients.

### FUNDING AVAILABLE FOR RESEARCH PROJECTS

The Committee on Publication Ethics (COPE) has established a Grant Scheme to fund research in the field of publication ethics. The Scheme is designed to provide financial support to any member of COPE for a defined research project that is in the broad area of the organisation’s interests, and specifically in the area of ethical standards and practice in biomedical publishing. The project should have a specific goal and be intended to form the kernel of a future publication.

A maximum sum of £5000 will be allocated to any one project, but applications for smaller sums are welcomed.

**The terms and conditions of the Grant are as follows:**

- At least one of the applicants must be a member of COPE.
- Calls for applications will be made twice a year with closing dates of 1 December and 1 June. An electronic version of the application form must be sent to the Administrator no later than 12 pm (noon GMT) on the closing date for consideration by COPE Council.
- The application must contain a lay summary of the project, a definition of the question to be posed, sufficient methodological detail to allow assessment of the viability of the project, a clear timeline and a definition of the likely deliverables. A full justification for the sum requested must accompany the application.
- A report on the progress of the research should be presented within one year of the award and at the end of the project. The grant must be used within two years from the date of award, and balance sheets must be forwarded annually. These should be sent to the Administrator. Any remaining funds after two years must be returned.
- It is anticipated that the work stemming from the project will be presented at one of COPE’s annual seminar meetings within 2–3 years of the award. Such data may also be published in peer-reviewed journals. Any publications or related presentations at meetings by the recipient emanating in part or whole from COPE’s support should be duly acknowledged and copies sent to the Administrator.

Applications are reviewed by a COPE sub-committee. Applicants will be advised of a decision as soon as practicable after the deadline date.

An application form can be obtained by contacting Linda Gough, COPE administrator, at LGough@bmj.com or 020 7383 6602. For more information on COPE, see [http://www.publicationethics.org.uk/](http://www.publicationethics.org.uk/)

The closing date for receipt of applications is 1 December 2007 or 1 June 2008.
