

GREEVES' *Portable* BJERRUM SCREEN

THIS Portable Bjerrum Screen has been made on the principles suggested by Mr. Affleck Greeves, F.R.C.S., and is designed to supply a long-felt need of ophthalmic surgeons for use in the consulting room.

Its exclusive feature is that the whole apparatus is very light and easily portable to any convenient position in the consulting room, and when not required for immediate use can be simply folded up and put away in a very small space, as illustrated in the smaller diagram. The screen is designed to work at one metre giving a field of 26 degrees. The charting is worked in black silk and is practically invisible at one metre. The lines are shown here in white for illustration purposes. Despite the lightness of this apparatus it is very substantially made, while the extremely moderate price will, we believe, make it attractive to a large number of ophthalmic surgeons and institutions.

The price complete is £4 4s. 0d.

Pads of 50 charts corresponding exactly to the marking on the screen are available at 2s. 6d. each pad.

THE MOVING PICTURE SYNOPTOPHORE

THIS instrument is a definite advance in orthoptic apparatus, and fills a long-felt want in muscle training. The interest of the child is maintained to a remarkable degree and the co-ordination between hand and eye movements greatly encouraged.

By a simple but ingenious device, coloured moving pictures are presented to each eye of the patient, and the movement can be maintained whilst the tubes are converged or diverged over the complete range of the instrument.

Attractively coloured transparencies such as fish swimming in a bowl, birds flying, aeroplanes landing and rising, may be supplied.

When not required the moving-picture attachment can be instantly removed and the Synoptophore used in the ordinary way. This attachment may be fitted to any metal-based Synoptophore.

PRICE: Moving Picture Attachment complete with one set of coloured transparencies, £12
