A similar relative comparison can presumably be made when dealing with the internal rectus in divergence.

If the muscle insertion is unusually far back an advancement may be expected to produce a still greater effect. In such cases, therefore, if a big reduction be necessary, I would suggest that advancement be the operation of choice. Again, where at the time of operation the muscle is found to be very poorly developed, an advancement would appear to offer a better chance of success.

The Qualifications of Ophthalmic Surgeons

In the columns of this Journal (March, 1918) we published an appeal that some degree or diploma should be open to ophthalmic surgeons commensurate with the position occupied by them in the medical profession. We then suggested that it would be useful in bridging the hiatus if ophthalmology were in part substituted for the final examination for the M.S. (Lond.) and the F.R.C.S. (Eng.). This would have far-reaching consequences, into which we need not enter at the moment. It is with satisfaction that we now learn that the Senate of London University has sanctioned the granting of the M.S. degree in two additional branches, one of which is ophthalmology. The regulations have been modified in accordance with the foregoing decision.

The Need of a New Eye Hospital in Calcutta

In our issue of May, 1919, we commented at some length on the apathy which has been displayed by the Government of Bengal
