

THE "CRUISE" STEREOSCOPE (WITH MADDOX ROTATABLE PRISMS)

Designed for varying the amount of duction for orthoptic exercises by means of rotatable prisms, preferably, but not necessarily, when using Hamblin's "Cruise" Series of Coloured Stereoscope Pictures. 20° of prism may be added imperceptibly by rotating the prisms while the child keeps the picture fused. The Stereoscope is strongly made in brass and aluminium, and will withstand hard wear.

HAMBLIN'S

Made entirely of metal; will withstand hard wear without becoming distorted. It has a specially long slide, an advantage over the ordinary Holmes pattern, as it affords a greater range of exercise. It is fitted with cells to take additional prisms

TRAINING STEREOSCOPE

and can be taken to pieces to pack away into a box of portable dimensions.

Diamonds

"Diamonds", a dictionary informs us "are pure carbon", to which unromantic statement it seems to hasten to add—"and the most valued of all precious stones." Their attraction is not surprising for, monetary value aside, diamonds have an exceptional strength and beauty that appeals to almost every lady and not a few men as well.

It is with pride that Spillers introduce this frame for it is probably the most charming of their very wide range. Very light in weight, the nitrate frame is of exceptional strength and beauty and is made in two tones with an extensive choice of colours. The "Featherette" is the essence of good taste.

The Spiller "Featherette"
