Paediatric neuro-Behçet’s disease presenting with optic nerve head swelling

EDITOR,—Involvement of the central nervous system in Behçet’s disease (BD) occurs in approximately 10–49% of patients and the frequency of ocular manifestations is believed to be in the range of 28–80%. Neuropapillitis has been reported very rarely as a manifestation of Behçet’s disease.1 As far as we know, there has been no report of paediatric onset neuropapillitis in BD. Here we report a case of neuropapillitis in a 10 year old girl.

CASE REPORT
A 10 year old Omani girl presented in August 1998 with complaint of right sided headache and blurring of vision in the right eye for 10 days and complete loss of vision in the same eye for 5 days. There was no history of vomiting, loss of consciousness, convulsion, or any other neurological deficit. On admission, examination revealed total vision loss in the right eye. The vision was 20/20 in the left eye. Examination of right eye showed relative afferent pupillary defect and fundus examination revealed blurred disc margins with no apparent cup. There was a 2 dioptre elevation of the disc (Fig 1).

Visual evoked potentials (VEP) and brainstem auditory evoked potentials (BAEP) on the right side were prolonged in latency and poorly formed. Magnetic resonance imaging of the brain revealed left sided temporalparietal lesion suggestive of inflammation/demyelination. The child was started on methylprednisolone 500 mg intravenously in two doses followed by 15 mg/day for 2 weeks. Vision returned on day 2 with perception of light. The child recovered with steroids (prednisolone) and diuretics (acetazolamide), which are recommended in the severe form of Behçet’s disease.2 Later the child had a cerebrovascular accident that also recovered with steroids. There was no underlying cause found. It was on follow up, when the child had aphthous ulcer and skin rash, that diagnosis of Behçet’s disease (neuro-Behçet’s) was finally confirmed (last admission) she presented with loss of vision in right eye and investigations—for example, VEP, suggested neuropapillitis.3 The diagnosis of Behçet’s disease was made on two major criteria (oral aphthous ulcers and skin lesions) and minor criteria of skin biopsy suggestive of lymphocytic vasculitis,4 CNS involvement and abnormal changes in the magnetic resonance imaging (MRI) of the brain.5 We reviewed the ophthalmological manifestations of BD in 32 patients. Inflammatory involvement of the optic nerve in the form of papillitis was reported in their three patients. Our case here is the first reported case of inflammatory optic nerve involvement in the paediatric age group, and clinically resembles multiple sclerosis (MS) as reported in adults by Kansu et al.6 Multiple sclerosis is rare at this age and the presentation of aseptic meningitis, papilloedema, skin lesion, and aphthous ulcer, with MRI showing a single patch of demyelination, excludes this possibility. The MRI of the optic nerve was normal despite abnormal VEP in our case. Unless the patient presents with clear symptoms, the diagnosis of Behçet’s disease is difficult initially. The diagnosis in children is more difficult as the disease is uncommon and usually the diagnosis is made after several systemic presentations and the exclusion of other common diseases.

Should diabetic patients be screened for glaucoma?

EDITOR,—In their article, Ellis et al claimed to have “reviewed all potentially relevant English language articles from 1966 to 1997.” It is unfortunate that they did not define the method of detecting such articles as it may have cast light upon the omission of perhaps the most complete study yet performed on the subject. This was published in April 1997, nearly 2 years before the publication of the perspective and approximately 6 months before the Royal College Guidelines on Ocular Hypertension and Glaucoma (although after the “last revision” date). The inclusion of other articles from 1997 in the reference list would appear to indicate that their quoted dates of 1966 to 1987 were inclusive rather than exclusive. The findings of a positive association of open angle glaucoma with diabetes was a result of an analysis of data from the Blue Mountains eye study, a carefully controlled population study of a large community of people aged 49 and over. This study would appear to come closest to Ellis et al’s ideal in view of the non-IOP based nature of the glaucoma diagnosis and the use of fasting glucose levels in the one not already known to be diabetic.

I would encourage all those who read the perspective to study Mitchell et al’s paper and thereby come to their own conclusions concerning the question “Should diabetic patients be screened for glaucoma?”

S A VERNON
Consultant ophthalmologist and chairman, Royal College Working Party responsible for the 1997 Guidelines on Ocular Hypertension and Glaucoma

EDITOR,—We are grateful to the chairman of the Royal College Working Party responsible for the 1997 guidelines on ocular hypertension and glaucoma,1 Mr S Vernon, for highlighting our inadvertent omission of the Blue Mountains eye study paper2 which was available to the working party before the publication of the guidelines. The omission of this paper from our review was unintentional and unfortunate.

The strengths of this rigorous study are its population based sampling frame, its careful definition of diabetes, and its definition of glaucoma to include field loss matching disc changes regardless of intraocular pressure. The overall prevalence of diabetes was 7.0% of whom 98% had type 2 diabetes and 15% were newly diagnosed during the course of the study (by fasting glucose test). The prevalence of POAG was 3.0% (108 patients). At least half the glaucoma cases were newly diagnosed by the researchers. The prevalence of diabetes in the 54 pre-study diagnosed
Hertel exophthalmometry: the most appropriate measuring technique

**Editor.**—The common method used in Hertel exophthalmometry is aligning the corneal apex with the reference cone on the exophthalmometer and noting the position of this alignment on the millimetre scale (method 1). Keeler, the manufacturers of the exophthalmometer, recommend that the reference cone is aligned with the reference line on the millimetre scale and the position of the anterior surface of the cornea on the millimetre scale noted (method 2). Our study, in which two masked observers of differing experience examined 50 patients using these two methods, set up to compare the results obtained using the two methods, determine if they could be used interchangeably, and whether we could recommend one method over the other.

This is the long awaited second edition of this volume in the WHO international histological classification of tumours series. With the exception of Dr Sobin, only two of the participants in the second edition were involved in the preparation of the first and, inevitably, this reviewer turned to the first edition to compare it with the second. The second edition is now in a much more user friendly paperback format and the material has been reorganised in a more logical and simpler way than in the first edition. Further improvement is now at the end of the book rather than halfway through as it was in the 1980 version. Another major improvement in the second edition is the addition of the TNM classification of tumours of the eye and its adnexa. It makes sense to have the TNM classification included along with histological typing of tumours rather than having to refer to the separately published TNM classification of malignant tumours whenever one is examining the pathology. The photomicrographs are also generally of a higher quality than in the 1980 edition. However, the second edition is not entirely an improvement on its predecessor. I would have to take issue with the claim on the back cover that it "is more extensive and detailed than the previous edition". It is certainly more extensive with regard to the number of tumours mentioned, but not more detailed, as there are far fewer explanatory notes than in the first edition, and the explanatory notes suffer from a degree of selectivity which is not always obvious. Furthermore, the classification suffers from the "overlap syndrome" and descriptions of skin tumours and CNS tumours would be better left to the relevant histological typing volumes. For example, the explanation of glioblastoma multiforme as "anaplastic pleomorphic cells with or without necrosis replace the normal optic tissue" is hardly a helpful description of what is, in reality, an extremely rare tumour of the optic nerve.

Although the photomicrographs are generally of higher quality, there are in fact fewer (112 × 150) in the second edition and once again they are highly selected for reasons which are not immediately obvious—for example, there are four figures of a phacomatous choristoma of the eyelid including immunocytochemistry but only one of the much commoner and more difficult problem of juxtapunctival intraepithelial neoplasia. Final gripes about the photographs relate to the absence of arrows to point out subtle features and inconsistencies in some of the figure legends—for example, "undiifferentiated sebaceous carcinoma" when, by definition, there must be evidence of sebaceous differentiation in order for the diagnosis of sebaceous carcinoma to made.

All in all, I think the second edition is something of an improvement on the first edition. It is now more user friendly and the addition of the TNM classification is very helpful. However, the book still suffers from the problems which bedevilled the whole series of WHO histological classifications—selectivity, "lowest common denominator" classification, and the construction of the classification by a small group of monospecialists. Nevertheless, the book will still be useful as a common language for use in ophthalmic oncology and a way of resolving disputes between pathologists at meetings.

J MACKENZIE

The fifth edition of Walsh and Hoyt's Clinical Neuro-Ophthalmology is a very extensive piece of work that consists of five volumes and involves over 70 authors. It is the best book in neuro-ophthalmology and is considered to be the reference standard in this area with appeal not only to ophthalmologists but also to neurologists and neurosurgeons. The fourth edition took two authors 14 years to complete and suffered as a result by quickly becoming out of date. To avoid this, the present edition has multiple authors and was completed in the remarkably short time of two years. Volume one covers the whole sensory system, the autonomic system, the ocular motor system, eyelid function, the sensory innervation of the eye and orbit, and non-organic disease. Volume two examines tumours, paraneoplastic syndromes, like chemotherapy, phacomatoses, and degener-
Lasers: The author has managed to achieve this goal as well as their aim to make this book both practical and useful—a "how to" on laser treatment. They have managed to achieve this goal as well as their aim to make this book both practical and useful—a "how to" on laser treatment. They have managed to achieve this goal as well as the other advantages of their book, which could make accessing a particular section on "special cases", where there are other coexistent ocular conditions, is included. An superb set of stereo fundus photographs and angiograms in slide form complement the chapter on choroidal neovascularisation. A stereo viewer is provided, which is very easy to use. At the start of the chapter, the reader is guided through the interpretation of both fluorescein and indocyanine green angiography. Advice is given on the management of recurrent choroidal neovascularisation post-treatment, and this is illustrated with clinical examples. The authors give their own guidelines for treating lesions near the fovea. There is an extensive presentation of the Macular Photocoagulation Study findings in summary form, with references. This is a very useful feature and will no doubt be helpful to those preparing for clinical exams.

Guidelines on the management of retinal tears and a variety of retinal vascular and chorioretinal conditions are presented in a separate chapter. The book concludes with a number of self-assessment MCQs. These are chapter based and broadly cover the information presented. Detailed explanations are provided with the answers.

In summary, the book is compact, succinct, and easy to read with the essential information readily accessible through a well designed "contents" section. The treatment guidelines that are suggested are evidence based and follow the major multicentre trial findings. Important practical points are often included in highlighted checklists for easy reference. For those wishing to read further about a particular subject, the references are very comprehensive. With its practical emphasis, it would be a welcome addition to any eye department library.

I think individuals preparing for clinical examinations will find this book helpful, as would anyone wanting to learn how to perform laser treatment safely and effectively.

JOHN A OLSON

This paperback book is part of a series written for optometry students preparing for their final professional qualifying examination. The ophthalmologist, in preparation for optics and refraction examinations or wishing to revise issues of refraction and spectacle prescription in clinical practice, may find it useful, however, as it raises practical problems to which answers may not be easily accessible in other texts—for example, manufacturing imperfections of trial lens sets or dealing with unfamiliar equipment.

Divided into three sections, the first concentrates on the optometric eye examination and a review of necessary equipment for setting up a practice. Basic examination techniques, courtesies, and the issues and responsibilities in the maintenance of clinical records are discussed. This material may not all be directly applicable to an ophthalmologist, but does lend insight to the perspectives of a fellow profession, from whom a large number of referrals are derived.

Section 2 is devoted to the performance of refraction, with useful tips and advice on objective and subjective refraction, including reviews of estimation of refraction from Snellen vision testing, near addition prescribing, and the use of cross-cylinders. There is an extensive discussion on techniques and indications, and the approach is logical, opening with an adequate resume of the relevant anatomy, well illustrated with drawings and photomicrographs of CT scans. The advantages and disadvantages of the various forms of orbital imaging are well covered as are the common orbital disorders. A chapter on orbital pathology would have enhanced the text, although this is a minor criticism. The descriptions and drawings of the surgical approaches to the orbit are first rate as is the section on decompression of the orbit. The approach is balanced, describing both the advantages and disadvantages of the various techniques. Examination or wishing to revise issues of refraction and spectacle prescription in clinical practice, may find it useful, however, as it raises practical problems to which answers may not be easily accessible in other texts—for example, manufacturing imperfections of trial lens sets or dealing with unfamiliar equipment.

The latest issue of Ageing and the Eye (no 29) discusses ageing and the eye. Included are papers on ageing and the eye from a global perspective; epidemiology; delivery of eye care to the elderly; and age related macular disease. For further information please contact Community Eye Health, International Centre for Eye Health, Institute of Ophthalmology, 11–43 Bath Street, London EC1V 9EL. (Tel: (+44) 171 608 6908/6910/6923; fax: (+44) 171 250 3207; email: eyeresource@ucl.ac.uk) Annual subscription £25. Free to workers in developing countries.

Residents’ Foreign Exchange Programme

Any resident interested in spending a period of up to one month in departments of ophthalmology in the Netherlands, Finland, Ireland, Germany, Denmark, France, Austria, or Portugal should apply to: Mr Robert Archbald, Secretary of the Foreign Exchange Committee, European Board of Ophthalmology, Institute of Ophthalmology, University College Dublin, 60 Eccles Street, Dublin 7, Ireland.

International Agency for the Prevention of Blindness

The sixth general assembly of the International Agency for the Prevention of Blindness will be held on 5–6 September 1999 at the Conference Centre, Beijing Friendship Hotel, Beijing, People’s Republic of China. The theme is “The right to sight”. Further details: IAPB Secretariat, LV Prasad Eye Institute, LV Prasad Marg, Banjara Hills, Hyderabad 500 034, India (tel: 091-40-215838; fax: 091-40-248271; email: IAPB@hvpeye.stph.net).

Ophthalmological Clinic, University of Creteil

An international symposium on the macula will be held on 1–2 October 1999 at the Ophthalmological Clinic, University of Creteil. Further details: Professor G Soubrance, Chef de Service, Clinique Ophthalmologique Universitaire de Creteil, Centre Hospitalier Intercommunal, 40 Avenue de Verdun, 94010 Creteil, France (fax: 01 45 17 52 27).

Jules François Prize

The 2000 Jules François Prize of $100 000 for scientific research in ophthalmology will be awarded to a young scientist who has made an important contribution to ophthalmology. All topics in the field of fundamental and/or clinical research in ophthalmology will be considered. The application should be sent jointly with a curriculum vitae, the list of all publications, and three copies of the candidate’s 10 most relevant publications to Jules François Foundation Secretary, Professor Dr M Hansens, Dienst Oogheelkunde, de Pintelaan 185, 292358; email: nuzzi@ipruniv.cce.unipr.it).

Joachim Kuhlmann Fellowship for Ophthalmologists 2000

The Joachim Kuhlmann AIDS Foundation, Essen, Germany, is sponsoring two fellowships per year for ophthalmologists at a well known institute, who want to train in CMV retinitis and other HIV related ophthalmological diseases. The fellowships are valued at $US5000 each. Deadlines for applications are 31 January and 31 July. Detailed applications, including CV and publication list, should be sent to the Joachim Kuhlmann AIDS Foundation, Bismarckstrasse 55, 45128 Essen, Germany (tel: 0201 87910-87; fax: 0201 87910-99; email: jk-stiftung@t-online.de).

XXXIV Nordic Congress of Ophthalmology

The XXXIV Nordic Congress of Ophthalmology will be held in Reykjavik, Iceland, 18–21 June 2000. This meeting celebrates the 100 year anniversary of the Nordic Ophthalmology Conference. Further details: Iceland Incentives Inc, Hamarrborg 1–3, Is-Kopavogur, Iceland (tel: +354 554 1400; fax: +354 554 1472; email: incentiv@itn.is).

5th International Vitreoretinal Meeting–IVV 2000

The 5th International Vitreoretinal Meeting–IVV 2000 will be held in Parma, Italy, on 26–27 May 2000. The main topics will include “Hypotony and glaucoma in vitreoretinal surgery”, “Internal limiting membrane surgery”, “Macula oedema”, “Open globe injuries”, and “News in retinal pigment epithelium”. Further details: C Cantu, MA De Giovanni, or S Tedesco, Scientific Secretary, Institute of Ophthalmology, University of Parma, Via Gramsci 14, 43100 Parma, Italy (tel: ++39 0521 259106; fax: ++39 0521 292358; email: nuzzi@ipruniv.cce.unipr.it).

12th Afro-Asian Congress of Ophthalmology

The 12th Afro-Asian Congress of Ophthalmology (AFACO) will be held on 11–15 November 2000 in Guangzhou (Canton), China. The theme is “Advances of ophthalmology and the 21st century”. Further details: Professor Lzeheng Wu, Zongshan Eye Center, SUMS, New Building, Room 919, 54 Xianlie Nan Road, Guangzhou 510060, PR China (tel: +86-20-8760 2402; fax: +86-20-8777 3370; email: lwuicv@gszums.edu.cn).
