

THEODORE HAMBLIN LTD LONDON, W.1.

OPTICIANS

TRIAL LENSES

The advantages of Hamblin's Trial Lenses are briefly as follows. Diameter of whole lens usual $1\frac{1}{2}$ inches, but lens proper only $\frac{3}{4}$ inch, thus making weight even in high powers negligible. All lenses of equal thickness. All lenses plane on one side, allowing cylinder and sphere to be placed in position with minimum of space between, thus giving a combination nearly approximating that of the finished lens to be ultimately worn by patient. Powers and axes engraved, plainly readable when in ordinary frame. Raised rim round mount facilitates handling and protects lens from scratches. The case is well made in

Ordinary Lenses.

Our Improved Luminous "Morton" Ophthalmoscope (Patented.)

Is a stride towards perfection. This instrument combines the improvements of previous models and in addition is arranged for easy conversion into non-luminous direct *and* indirect method. The luminous mirror arm is quickly removed and replaced by the non-luminous arm.
