

Supplementary Figure 4. The OCT scans of patients with pathogenic variants in *ARR3* in our cohort. (A-H) Most patients presented with preservation structure of macular fovea. (I) Some adult patients with *ARR3*-associated MYP26 show myopic macular dystrophy, especially atrophic sensory retinas. (J) One 32-year-old affected female presented with slightly shallow fovea. The top-right number shows the examined age of each OCT scan (Y: years old), while the refraction data was in the low-right of each image.
